# LEAF-WISE INTERSECTIONS AND RABINOWITZ FLOER HOMOLOGY

PETER ALBERS AND URS FRAUENFELDER

Abstract. In this article we explain how critical points of a particular perturbation of the Rabinowitz action functional give rise to leaf-wise intersection points in hypersurfaces of restricted contact type. This is used to derive existence and multiplicity results for leaf-wise intersection points in hypersurfaces of restricted contact type in general exact symplectic manifolds. The notion of leaf-wise intersection points was introduced by Moser [Mos78].

## 1. Introduction

We consider a closed hypersurface $\Sigma \subset (M, \omega = d\lambda)$ in an exact symplectic manifold $(M, \omega)$ such that $(\Sigma, \alpha := \lambda_{|\Sigma})$ is a contact manifold. Moreover, we assume that $\Sigma$ bounds a compact region in $M$ and that $M$ is convex at infinity, that is, $M$ is isomorphic to the symplectization of a compact contact manifold at infinity. $\Sigma$ is foliated by the leaves of the characteristic line bundle which is spanned by the Reeb vector field $R$ of $\alpha$. For $x \in \Sigma$ we denote by $L_x$ the leaf through $x$. Furthermore, we denote by $\mathrm{Ham}_c(M, \omega)$ the group of compactly supported Hamiltonian diffeomorphism. The following question was addressed by Moser [Mos78].

**Question.** Given $\phi \in \mathrm{Ham}_c(M, \omega)$, does there exist a leaf-wise intersection point, that is, $x \in \Sigma$ with $\phi(x) \in L_x$?

**Definition 1.1.** We denote by $\wp(\Sigma, \alpha) > 0$ the minimal period of a Reeb orbit of $(\Sigma, \alpha)$ which is contractible in $M$. If there exists no contractible Reeb orbit we set $\wp(\Sigma, \alpha) = \infty$.

Our first main result is the following.

**Theorem A.** *If $\phi \in \mathrm{Ham}_c(M, \omega)$ has Hofer norm $||\phi|| < \wp(\Sigma, \alpha)$, then there exists a leaf-wise intersection point for $\phi$.*

**Remark 1.2.** The case $(M, \Sigma) = (\mathbb{R}^{2n}, S^{2n-1})$ shows that Theorems A is sharp since $\wp(S^{2n-1})$ equals the displacement energy of the sphere $S^{2n-1}$. In particular, the smallness assumption in Theorem A is necessary.

The proof of Theorem A uses a stretching of the neck argument for gradient flow lines of a perturbed, time dependent Rabinowitz action functional. More sophisticatedly, using local Rabinowitz Floer homology around the action value 0 we obtain the following multiplicity result.

**Theorem B.** *For a generic Hamiltonian diffeomorphism $\phi \in \mathrm{Ham}_c(M, \omega)$ with $||\phi|| < \wp(\Sigma, \alpha)$*

$$\#\{\textit{leaf-wise intersection points}\} \geq \sum_i b_i(\Sigma, \mathbb{Z}/2)\ . \tag{1.1}$$

---

2000 *Mathematics Subject Classification.* 53D40, 37J10, 58J05.

*Key words and phrases.* Leaf-wise Intersections, Rabinowitz Floer homology, stretching the neck, local homology.

If the full Rabinowitz Floer homology is non-zero we obtain much stronger results. For the construction of Rabinowitz Floer homology we refer the reader to [CF09], see also Section 2.3.

**Theorem C.** *If the Rabinowitz Floer homology of* $(M,\Sigma)$ *does not vanish,* $\mathrm{RFH}(M,\Sigma)\neq 0$*, then there always exists a leaf-wise intersection point for* $\psi\in\mathrm{Ham}_c(M,\omega)$.

We point out that we make no assumption on the Hofer norm of $\psi$. Moreover, as mentioned above, without the assumption $\mathrm{RFH}(M,\Sigma)\neq 0$ Theorem C does not hold in general.

**Remark 1.3.** In the article [CF09] examples with non-vanishing Rabinowitz Floer homology are provided. See [CFO09] for further examples.

**Remark 1.4.** The leaf-wise intersection points found in Theorems A and B are always contractible in the following sense. For any Hamiltonian function $H:S^1\times M\longrightarrow\mathbb{R}$ such that $\phi=\phi_H$ the leaf-wise intersection point can be completed to a loop $\gamma$ by first following the flow of $\phi_H^t$ and then the Reeb flow in such a way that $\gamma$ is contractible in $M$, see Lemma 2.13 below.

**Remark 1.5.** As in Theorem B local Rabinowitz Floer homology around the action value of a non-contractible Reeb orbit can be considered. Similar techniques then lead to existence results for non-contractible leaf-wise intersections points. In fact, generically each Reeb orbit gives rise to two different leaf-wise intersection points since the local homology is isomorphic to the homology of a circle.

## 1.1. **History of the problem and related results.**

The problem addressed above is a special case of the leaf-wise coisotropic intersection problem. For that let $N\subset(M,\omega)$ be a coisotropic submanifold. Then $N$ is foliated by isotropic leafs. The problem asks for a leaf $L$ such that $\phi(L)\cap L\neq\emptyset$ for $\phi\in\mathrm{Ham}_c(M,\omega)$.

The first result was obtained by Moser in [Mos78] for simply connected $M$ and $C^1$-small $\phi$. This was later generalized by Banyaga [Ban80] to non-simply connected $M$.

The $C^1$-smallness assumption was replaced by Hofer, Ekeland-Hofer in [Hof90],[EH89] for hypersurfaces of restricted contact type in $\mathbb{R}^{2n}$ by a much weaker smallness assumption, namely that the Hofer norm of $\phi$ is smaller than a certain symplectic capacity. Only recently, the result by Ekeland-Hofer was generalized in two different directions. It was extended by Dragnev [Dra08] to so-called "coisotropic submanifolds of contact type in $\mathbb{R}^{2n}$". Among other results Ginzburg [Gin07] generalized from restricted contact type in $\mathbb{R}^{2n}$ to restricted contact type in subcritical Stein manifolds. Moreover, examples by Ginzburg [Gin07] show that the Ekeland-Hofer result is a symplectic rigidity result, namely it becomes wrong for arbitrary hypersurfaces. Recently Ziltener [Zil08] and Gurel [Gur09] obtained results on leaf-wise intersection points using entirely different methods from this article.

Theorem A gives a complete answer to the existence problem of leaf-wise intersection points within the class of restricted contact type hypersurfaces. After this article was published on the arXiv an independent proof of Theorem A was given by Gurel [Gur09].

Theorem B is (to the authors' knowledge) the first time that a general multiplicity result for leaf-wise intersection points in the Hofer-small case is proved. In the $C^1$-small case multiplicity results were obtained by Moser and Banyaga. In the special case of fibrations Ziltener [Zil08] proves similar multiplicity results to Theorem B.

Theorem C is (again to the authors' knowledge) the first global (i.e. valid for all Hamiltonian diffeomorphisms) existence result for leaf-wise intersection points.

*Acknowledgments.* We thank Felix Schlenk for helpful comments. This article was written during visits of the first author at the Ludwig-Maximilians-Universität München and visits of the second author at the ETH Zürich. Both authors thank these institutions for their stimulating working atmospheres. ## 2. A perturbation of the Rabinowitz action functional

We recall that $\Sigma \subset (M, \omega = d\lambda)$ is a closed hypersurface in an exact symplectic manifold such that $(\Sigma, \alpha = \lambda_{|\Sigma})$ is a contact manifold. Moreover, $\Sigma$ is assumed to bound a compact region in $M$. We denote by $R$ the Reeb vector field of $\alpha$. Moreover, we define the vector field $Y$ by $d\lambda(Y, \cdot) = \lambda(\cdot)$.

**Lemma 2.1.** The vector field $Y$ is a Liouville vector field for $(\Sigma, \alpha)$, that is, $\mathcal{L}_Y \omega = \omega$ and $Y \pitchfork \Sigma$. In particular, $(\Sigma, \alpha)$ is of restricted contact type.

Proof. Since $\lambda(Y) = d\lambda(Y, Y) = 0$ we compute $\mathcal{L}_Y \lambda = d(\iota_Y \lambda) + \iota_Y d\lambda = \lambda$. Since the Lie derivative commutes with the exterior differential we conclude $\mathcal{L}_Y \omega = \omega$. If we assume that $Y \in T_x\Sigma$ then $0 = d\alpha(Y, R) = d\lambda(Y, R) = \lambda(R) = \alpha(R) = 1$. This contradiction shows $Y \pitchfork \Sigma$. □

The flow $\phi_Y^t$ of the Liouville vector field is defined near $\Sigma$. We fix $\delta_0 > 0$ so that $\phi_Y^t|_\Sigma$ is defined for all $|t| \leq \delta_0$ and define a function $\widehat{G}$ by $\widehat{G}(\phi_Y^t(x)) = t$ for all $x \in \Sigma$. For $0 < \delta \leq \delta_0$ we set

$$U_\delta := \{x \in M \mid |\widehat{G}(x)| < \delta\}. \tag{2.1}$$

Since $\Sigma$ bounds we can choose a $G : M \longrightarrow \mathbb{R}$ which is locally constant outside $U_{\delta_0}$, coincides with $\widehat{G}$ on $U_{\frac{\delta_0}{2}}$, and such that $G^{-1}(0) = \Sigma$. Thus, the Hamiltonian vector field $X_G$ of $G$ satisfies $X_G|_\Sigma = R$. Finally, we fix a smooth function $\rho : S^1 \longrightarrow \mathbb{R}$ with $\int_0^1 \rho(t)dt = 1$ and $\mathrm{supp}(\rho) \subset (0, \frac{1}{2})$ and set

$$F(t, x) := \rho(t)G(x) \ . \tag{2.2}$$

Therefore, the Hamiltonian vector fields satisfy

$$X_F(t, x) = \rho(t)X_G(x) \ . \tag{2.3}$$

We recall the definition of the positive and negative part of the Hofer norm.

**Definition 2.2.** Let $H : S^1 \times M \longrightarrow \mathbb{R}$ a compactly supported Hamiltonian function. We set

$$||H||_+ := \int_0^1 \max_{x \in M} H(t, x)dt \qquad ||H||_- := -\int_0^1 \min_{x \in M} H(t, x)dt = ||-H||_+ \tag{2.4}$$

and

$$||H|| = ||H||_+ + ||H||_- \ . \tag{2.5}$$

For $\phi \in \mathrm{Ham}_c(M, \omega)$ the Hofer norm is

$$||\phi|| = \inf\{||H|| \mid \phi = \phi_H\} \ . \tag{2.6}$$

**Lemma 2.3.** For all $\phi \in \mathrm{Ham}_c(M, \omega)$

$$||\phi|| = |||\phi||| := \inf\{||H|| \mid \phi = \phi_H, \ H(t, \cdot) = 0 \ \ \forall t \in [0, \tfrac{1}{2}]\} \ . \tag{2.7}$$

Proof. $||\phi|| \leq |||\phi|||$ is obvious. To prove the reverse inequality pick a smooth monotone map $r:[0,1]\to[0,1]$ with $r(\frac{1}{2})=0$ and $r(1)=1$. For $H$ with $\phi_H=\phi$ we set $H^r(t,x):=r'(t)H(r(t),x)$. Then a direct computation shows $\phi_{H^r}=\phi_H$, $||H^r||=||H||$, and $H^r(t,x)=0$ for all $t\in[0,\frac{1}{2}]$. This finishes the proof. □

From now on we assume that $H(t,\cdot)=0$ for all $t\in[0,\frac{1}{2}]$. Then for $F$ as in equation (2.2) the perturbed Rabinowitz action functional is defined as follows

$$\mathcal{A}_H^F(u,\eta):=-\int_0^1 u^*\lambda-\int_0^1 H(t,u(t))dt-\eta\int_0^1 F(t,u(t))dt \tag{2.8}$$

where $u\in C^\infty(S^1,M)$ and $\eta\in\mathbb{R}$. Critical points $(u,\eta)\in\mathrm{Crit}\mathcal{A}_H^F$ satisfy

$$\left.\begin{aligned} &\partial_t u = X_H(t,u)+\eta X_F(t,u)\\ &\int_0^1 F(t,u)dt=0 \end{aligned}\right\} \tag{2.9}$$

In the following proposition we observe that existence of a critical point of $\mathcal{A}_H^F$ gives rise to a positive answer of the leaf-wise intersection problem mentioned in the introduction.

**Proposition 2.4.** *Let $(u,\eta)\in\mathrm{Crit}\mathcal{A}_H^F$. Then $x=u(\frac{1}{2})$ satisfies $\phi_H(x)\in L_x$. Thus, $x$ is a leaf-wise intersection point.*

Proof. For $t\in[0,\frac{1}{2}]$ we compute, using $H(t,\cdot)=0$ for all $t\leq\frac{1}{2}$,

$$\begin{aligned}\frac{d}{dt}G(u(t)) &= dG(u(t))\cdot\partial_t u\\ &= dG(u(t))\cdot[\underbrace{X_H(t,u)}_{=0}+\eta\underbrace{X_F(t,u)}_{=\rho(t)X_G(u)}]\\ &=0\,,\end{aligned} \tag{2.10}$$

since $dG(X_G)=0$. Hence $G(u(t))=c=$const for $t\leq\frac{1}{2}$. Thus,

$$0=\int_0^1 F(t,u)dt=\int_0^1\rho(t)G(u(t))dt=c \tag{2.11}$$

Therefore, $G(u(t))=c=0$, and since $G^{-1}(0)=\Sigma$ we have $u(t)\in\Sigma$ for $t\in[0,\frac{1}{2}]$. In particular, $u(\frac{1}{2}),u(0)=u(1)\in\Sigma$.

For $t\in[\frac{1}{2},1]$ we have $F(t,\cdot)=0$. Thus, the loop $u$ solves the equation $\partial_t u=X_H(t,u)$ on $[\frac{1}{2},1]$, and therefore, $u(1)=\phi_H(u(\frac{1}{2}))$. We conclude that $\phi_H(u(\frac{1}{2}))\in\Sigma$. Using again that for $t\in[0,\frac{1}{2}]$, $\partial_t u=X_H(t,u)+\eta X_F(t,u)=\eta X_F(t,u)=\eta\rho(t)X_G(u)$ and $u(t)\in\Sigma$ we see that $u(1)=u(0)\in L_{u(\frac{1}{2})}$ since $X_G|_\Sigma=R$.

With the definition $x:=u(\frac{1}{2})$ we then have $\phi_H(x)=u(1)\in L_x$. This concludes the proof. □

In the following we establish necessary analytical properties of the perturbed Rabinowitz action functional. For later purposes we allow from now on the function $H$ to be $s$-dependent as follows: $H_s(t,x)=H_-(t,x)$ for $s\leq-1$ and $H_s(t,x)=H_+(t,x)$ for $s\geq1$. Moreover, $H_s(t,\cdot)=0$ for $t\in[0,\frac{1}{2}]$, and $H_s$ has compact support uniformly in $s$. We choose a family

$J(s,t)$ of compatible almost complex structures on $M$ such that $J(s,t)$ is independent of $s$ for $s\leq -1$ and $s\geq 1$. The norm of the gradient of $\mathcal{A}_H^F$ equals

$$||\nabla\mathcal{A}_H^F(u,\eta)||^2=||\partial_t u-X_{H_s}(t,u)-\eta X_F(t,u)||_{L^2}^2+\Big|\int_0^1 F(t,u(t))dt\Big|^2 \tag{2.12}$$

where the $L^2$ norm is taken with respect to the metric $g_{(s,t)}(\cdot,\cdot):=\omega(\cdot,J(s,t)\cdot)$. We denote by $\mathscr{L}$ the component of the contractible loops in $M$.

**Definition 2.5.** A gradient flow line of $\mathcal{A}_H^F$ is (formally) a map $w=(u,\eta)\in C^\infty(\mathbb{R},\mathscr{L}\times\mathbb{R})$ solving the ODE

$$\partial_s w(s)+\nabla_s\mathcal{A}_H^F(w(s))=0\;, \tag{2.13}$$

where the gradient is taken with respect to metric $\mathfrak{m}_s$ defined as follows. Let $(\hat{u}_1,\hat{\eta}_1)$ and $(\hat{u}_2,\hat{\eta}_2)$ be two tangent vectors in $T_{(u,\eta)}(\mathscr{L}\times\mathbb{R})$. We set

$$\mathfrak{m}_s\big((\hat{u}_1,\hat{\eta}_1),\,(\hat{u}_2,\hat{\eta}_2)\big):=\int_0^1 g_{(s,t)}\big(\hat{u}_1,\hat{u}_2\big)dt+\hat{\eta}_1\hat{\eta}_2\;. \tag{2.14}$$

According to Floer's interpretation, [Flo88b], this means that $u$ and $\eta$ are smooth maps $u:\mathbb{R}\times S^1\longrightarrow M$ and $\eta:\mathbb{R}\longrightarrow\mathbb{R}$ solving

$$\left.\begin{aligned}&\partial_s u+J(s,t,u)\big(\partial_t u-X_{H_s}(t,u)-\eta X_F(t,u)\big)=0\\&\partial_s\eta-\int_0^1 F(t,u)dt=0.\end{aligned}\right\} \tag{2.15}$$

**Definition 2.6.** The energy of a map $w\in C^\infty(\mathbb{R},\mathscr{L}\times\mathbb{R})$ is defined as

$$E(w):=\int_{-\infty}^{\infty}||\partial_s w||^2 ds\;. \tag{2.16}$$

**Lemma 2.7.** *Let $w$ be a gradient flow line of $\nabla_s\mathcal{A}_H^F$. Then*

$$E(w)\leq\mathcal{A}_{H_-}^F(w_-)-\mathcal{A}_{H_+}^F(w_+)+\int_{-\infty}^{\infty}||\partial_s H_s||_- ds\;. \tag{2.17}$$

*Moreover, equality holds if $\partial_s H_s=0$.*

Proof. It follows from the gradient flow equation (2.13)

$$\begin{aligned}E(w)&=-\int_{-\infty}^{\infty}d\mathcal{A}_{H_s}^F(w(s))[\partial_s w]ds\\&=-\int_{-\infty}^{\infty}\frac{d}{ds}\Big(\mathcal{A}_{H_s}^F(w(s))\Big)ds+\int_{-\infty}^{\infty}\big(\partial_s\mathcal{A}_{H_s}^F\big)(w)ds\\&=\mathcal{A}_{H_-}^F(w_-)-\mathcal{A}_{H+}^F(w_+)-\int_{-\infty}^{\infty}\int_0^1\partial_s H_s(t,u)dtds\\&\leq\mathcal{A}_{H_-}^F(w_-)-\mathcal{A}_{H_+}^F(w_+)+\int_{-\infty}^{\infty}||\partial_s H_s||_- ds\;.\end{aligned} \tag{2.18}$$

□

**Lemma 2.8.** Let $w$ be a gradient flow line of $\nabla_s\mathcal{A}_H^F$. Then

$$|\mathcal{A}_H^F(w(s_0))| \leq \max\{\mathcal{A}_{H_-}^F(w_-), -\mathcal{A}_{H_+}^F(w_+)\} + \int_{-\infty}^{\infty} ||\partial_s H_s||_- ds \tag{2.19}$$

for all $s_0 \in \mathbb{R}$.

Proof. The proof follows from the proof of Lemma 2.7 by replacing in the first line $\int_{-\infty}^{\infty}$ by $\int_{-\infty}^{s_0}$ resp. $\int_{s_0}^{\infty}$, and $E(w) \geq 0$. □

**Theorem 2.9.** *Let $w_n = (u_n, \eta_n)$ be a sequence of gradient flow lines for which there exists $a < b$ such that*

$$a \leq \mathcal{A}_H^F\big(w_n(s)\big) \leq b \qquad \forall s \in \mathbb{R}\ . \tag{2.20}$$

*Then for every reparametrisation sequence $\sigma_n \in \mathbb{R}$ the sequence $w_n(\cdot + \sigma_n)$ has a subsequence which converges in $C^\infty_{\mathrm{loc}}(\mathbb{R}, \mathscr{L} \times \mathbb{R})$.*

Proof. The proof follows from standard arguments in Floer theory as soon as we establish

1. a uniform $L^\infty$ bound on $u_n$,
2. a uniform $L^\infty$ bound on $\eta_n$,
3. a uniform $L^\infty$ bound on the derivatives of $u_n$.

Indeed, assuming (1)–(3) bootstrapping the gradient-flow equation will establish $C^\infty_{\mathrm{loc}}$-convergence, see [MS04, Appendix B.4]. The $L^\infty$ bound on $u_n$ follows from the convexity at infinity of $(M, \omega)$. Once the $L^\infty$ bound on $\eta_n$ has been established, the $L^\infty$ bound on the derivatives of $u_n$ follows in the following way. If the derivatives would explode we would obtain non-constant holomorphic spheres as limits, see [MS04, Chapter 4.2]. But in an exact symplectic manifold non-constant holomorphic spheres don't exist. The $L^\infty$ bound on $\eta_n$ is the content of the following proposition. □

**Proposition 2.10.** *Given critical points $w_-, w_+ \in \mathrm{Crit}\mathcal{A}_H^F$ there exists a constant $\kappa = \kappa(w_-, w_+)$ such that every gradient flow line $w = (u, \eta)$ of $\mathcal{A}_H^F$ with $\lim_{s\to\pm\infty} = w_\pm$ satisfies*

$$||\eta||_{L^\infty(\mathbb{R})} \leq \kappa\ . \tag{2.21}$$

The proof of the proposition goes along the same lines as in [CF09, Corollary 3.3] and relies on the following lemma. The proof of the proposition is given after the proof of the lemma.

**Lemma 2.11.** There exists $\epsilon > 0$ and $C > 0$ such that for all $(u, \eta) \in C^\infty(S^1, M) \times \mathbb{R}$ we have

$$||\nabla_s\mathcal{A}_H^F(u, \eta)|| < \epsilon \quad \Longrightarrow \quad |\eta| \leq C\Big(|\mathcal{A}_H^F(u, \eta)| + 1\Big) \tag{2.22}$$

where the norm of the gradient is given in equation (2.12).

Proof. We will use again the notation introduced below the proof of Lemma 2.1. We fix $0 < 2\delta < \min\{1, \delta_0\}$, in particular, we have $G(x) = \widehat{G}(x)$ for $x \in U_\delta$.

Claim 1: Assume that $u(t) \in U_\delta$ for all $t \in (\frac{1}{2}, 1)$. Then there exists a constant $C_1 > 0$

$$|\eta| \leq C_1\Big(|\mathcal{A}_H^F(u, \eta)| + ||\nabla_s\mathcal{A}_H^F(u, \eta)|| + 1\Big)\ . \tag{2.23}$$

*Proof of Claim 1.* We compute

$$
\begin{aligned}
|\mathcal{A}_H^F(u,\eta)| &= \left| -\int_0^1 u^*\lambda - \int_0^1 H(s,t,u(t))dt - \eta\int_0^1 F(t,u(t))dt \right| \\
&\geq \left| -\int_0^1 u^*\lambda \right| - ||H||_{L^\infty} - \delta|\eta| \\
&\geq -||H||_{L^\infty} - \delta|\eta| + \bigg| \int_0^1 \lambda(u(t))\big[\partial_t u - X_{H_s}(t,u) - \eta X_F(t,u)\big]dt \\
&\qquad + \int_{\frac{1}{2}}^1 \lambda(u(t))\big[X_{H_s}(t,u)\big]dt + \underbrace{\int_0^{\frac{1}{2}} \lambda(u(t))\big[\eta \underbrace{X_F(t,u)}_{=\rho(t)R(u(t))}\big]dt}_{=\eta} \bigg| \\
&\geq |\eta| - \delta|\eta| - C_{\lambda,\delta}\, ||\partial_t u - X_{H_s}(t,u) - \eta X_F(t,u)||_{L^1} - C_{\lambda,H} \\
&\geq \tfrac{1}{2}|\eta| - C_{\lambda,\delta}\, ||\partial_t u - X_{H_s}(t,u) - \eta X_F(t,u)||_{L^2} - C_{\lambda,H} \\
&\geq \tfrac{1}{2}|\eta| - C_{\lambda,\delta}\, ||\nabla_s \mathcal{A}_H^F(u,\eta)||_{L^2} - C_{\lambda,H}
\end{aligned}
$$

where $C_{\lambda,\delta} := ||\lambda_{|U_\delta}||_{L^\infty}$ and $C_{\lambda,H} := ||H||_{L^\infty} + C_{\lambda,\delta}||X_H||_{L^\infty}$. This inequality immediately implies Claim 1. $\square$

Claim 2: There exists $\epsilon = \epsilon(\delta)$ with the following property. If for $(u,\eta)$ there exists $t \in [0,\frac{1}{2}]$ with $G(u(t)) \geq \delta$ then $||\nabla_s \mathcal{A}_H^F(u,\eta)|| \geq \epsilon$

*Proof of Claim 2.* If in addition $G(u(t)) \geq \frac{\delta}{2}$ holds for all $t \in [0,\frac{1}{2}]$ then using (2.12)

$$
||\nabla_s \mathcal{A}_H^F(u,\eta)|| \geq \left| \int_0^1 F(t,u(t))dt \right| \geq \frac{\delta}{2}\int_0^1 \rho(t)dt = \frac{\delta}{2} \tag{2.24}
$$

since $F(t,x) = \rho(t)G(x)$. Otherwise there exists $t' \in [0,\frac{1}{2}]$ with $G(u(t')) < \frac{\delta}{2}$. Thus, we can find $0 \leq a < b \leq \frac{1}{2}$ such that for all $t \in [a,b]$

$$
\frac{\delta}{2} = G(u(a)) \leq G(u(t)) \leq G(u(b)) = \delta \tag{2.25}
$$

or

$$
\delta = G(u(a)) \geq G(u(t)) \geq G(u(b)) = \frac{\delta}{2}\,. \tag{2.26}
$$

We only treat the first case. The second is completely analogous.

$$\begin{aligned}
||\nabla_s \mathcal{A}_H^F(u,\eta)|| &\geq ||\partial_t u - X_{H_s}(t,u) - \eta X_F(t,u)||_{L^2} \\
&\geq \left(\int_a^b ||\partial_t u - \underbrace{X_{H_s}(t,u)}_{=0} - \eta X_F(t,u)||^2 dt\right)^{\frac{1}{2}} \\
&\geq \left(\int_a^b \frac{1}{||\nabla G||^2}\big|g_t(\partial_t u, \nabla G) - \eta \underbrace{g_t(X_F(t,u),\nabla G)}_{=0}\big|^2 dt\right)^{\frac{1}{2}} \\
&\geq \frac{1}{||\nabla G||_{L^\infty}}\left(\int_a^b \left|\frac{d}{dt}G(u(t))\right|^2 dt\right)^{\frac{1}{2}} \qquad (2.27)\\
&\geq \frac{1}{||\nabla G||_{L^\infty}}\int_a^b \left|\frac{d}{dt}G(u(t))\right| dt \\
&\geq \frac{1}{||\nabla G||_{L^\infty}}\int_a^b \frac{d}{dt}G(u(t)) dt \\
&= \frac{\delta}{2||\nabla G||_{L^\infty}}
\end{aligned}$$

where we used $g_t(X_F, \nabla G) = dG(X_F) = \rho(t)dG(X_G) = \rho(t)\omega(X_G, X_G) = 0$. Since $||\nabla G||_{L^\infty} \geq 1$ we set $\epsilon(\delta) := \frac{\delta}{2}$. This proves Claim 2. □

Setting $3\delta := \min\{1, \delta_0\}$, $\epsilon := \epsilon(\delta)$ according to Claim 2, and $C := C_1 + \epsilon$, $C_1$ as in Claim 1, the lemma follows. □

Proof. (of Proposition 2.10) From Lemma 2.7 it follows that

$$E(w) \leq \mathcal{A}_{H_-}^F(w_-) - \mathcal{A}_{H_+}^F(w_+) + C_H \tag{2.28}$$

where $C_H := \int ||\partial_s H_s||_- ds$. We fix $\epsilon$ and $C$ as in Lemma 2.11. For $\sigma \in \mathbb{R}$ we define

$$\tau(\sigma) := \inf\{\tau \geq 0 \mid ||\nabla_s \mathcal{A}_H^F(w(\sigma+\tau))|| \leq \epsilon\} \tag{2.29}$$

and compute

$$E(w) \geq \int_\sigma^{\sigma+\tau(\sigma)} \underbrace{||\nabla_s \mathcal{A}_H^F(w(s))||^2}_{\geq \epsilon^2} ds \geq \tau(\sigma)\epsilon^2 \tag{2.30}$$

From the second equation in (2.15) it follows directly that

$$||\partial_s \eta||_{L^\infty} \leq ||F||_{L^\infty} \ . \tag{2.31}$$

The norm $||F||_{L^\infty}$ is finite since $dF = 0$ outside a compact set. Finally according to Lemma 2.8

$$|\mathcal{A}_H^F(w(s))| \leq \max\left\{\mathcal{A}_H^F(w_-), -\mathcal{A}_H^F(w_+)\right\} + C_H =: \Xi \tag{2.32}$$

The last three inequalities together with Lemma 2.11 imply

$$\begin{aligned}|\eta(\sigma)| &\leq |\eta(\sigma+\tau(\sigma))| + \int_\sigma^{\sigma+\tau(\sigma)} |\partial_s\eta| ds \\ &\leq C\Big( \big|\mathcal{A}_H^F\big(w(\sigma+\tau(\sigma))\big)\big| + 1\Big) + ||F||_{L^\infty}\tau(\sigma) \\ &\leq C(\Xi+1) + ||F||_{L^\infty}\frac{E}{\epsilon^2}\ .\end{aligned} \tag{2.33}$$

This proves the proposition. □

## 2.1. **Proof of Theorem A.**

Recall that $\mathcal{A}:\mathcal{E}\longrightarrow\mathbb{R}$ is a functional and $C\subset\mathrm{Crit}\mathcal{A}$ then $C$ is called a Morse-Bott component if the following two conditions hold.

- $C$ is a submanifold of $\mathcal{E}$
- For all $c\in C$ we have $T_cC=\ker\mathscr{H}_\mathcal{A}(c)$ where $\mathscr{H}_\mathcal{A}$ is the Hessian of $\mathcal{A}$.

**Lemma 2.12.** The subset $\Sigma\subset\mathrm{Crit}\mathcal{A}^F$ is a Morse-Bott component.

Proof. Let $c=(p,0)$ with $p\in\Sigma$. An element $(\hat{v},\hat{\eta})\in C^\infty(S^1,T_pM)\times\mathbb{R}$ is in the kernel of the Hessian $\mathscr{H}_\mathcal{A}^F(c)$ if and only if it solves the following equations

$$\left.\begin{aligned}\partial_t\hat{v}=\hat{\eta}\rho(t)X_G(p)\\ \int_0^1\rho(t)dG(p)\hat{v}dt=0\end{aligned}\right\} \tag{2.34}$$

Integrating the first equation we obtain

$$\hat{v}(1)=\hat{v}(0)+\hat{\eta}X_G(p)\ . \tag{2.35}$$

Using that $\hat{v}$ is a loop and $X_G(p)\neq0$ we conclude $\hat{\eta}=0$ and thus $\hat{v}=\hat{v}_0\in T_pM$. The second equation implies

$$dG(p)\hat{v}_0=0 \tag{2.36}$$

and therefore $\hat{v}_0\in T_p\Sigma=\ker dG(p)$. □

Proof. We choose $H:S^1\times M\longrightarrow\mathbb{R}$ such that $\phi_H=\phi$, $||H||<\wp(\Sigma,\alpha)$, and such that $H(t,x)=0$ for all $t\in[0,\frac{1}{2}]$, see Lemma 2.3. For $r\geq0$ we choose a smooth family of functions $\beta_r\in C^\infty(\mathbb{R},[0,1])$ satisfying

1. for $r\geq1$: $\beta_r'(s)\cdot s\leq0$ for all $s\in\mathbb{R}$, $\beta_r(s)=1$ for $|s|\leq r-1$, and $\beta_r(s)=0$ for $|s|\geq r$,
2. for $r\leq1$: $\beta_r(s)\leq r$ for all $s\in\mathbb{R}$ and $\mathrm{supp}\beta_r\subset[-1,1]$,
3. $\lim_{r\to\infty}\beta_r(s\mp r)=:\beta_\infty^\pm(s)$ exists, where the limit is taken with respect to the $C^\infty$ topology.

We set

$$K_r(s,t,x):=\beta_r(s)H(t,x)\ . \tag{2.37}$$

We fix a point $p\in\Sigma$ and consider the moduli space

$$\mathcal{M}:=\left\{(r,w)\in[0,\infty)\times C^\infty(\mathbb{R},\mathscr{L}\times\mathbb{R})\,\middle|\,\begin{array}{l}w\text{ solves (2.15) for }K_r\\ \lim\limits_{s\to-\infty}w(s)=(p,0),\ \lim\limits_{s\to\infty}w(s)\in\Sigma\end{array}\right\}\ . \tag{2.38}$$

Claim: If there exists no leaf-wise intersection point, then $\mathcal{M}$ is compact. Moreover, its boundary consists of the point $(0,p,0)$ only.

Assuming the Claim we prove the assertion of Theorem A. The moduli space $\mathcal{M}$ is the zero-set of a Fredholm section of a Banach-space bundle over a Banach manifold. Its index equals 1. Moreover, since by Lemma 2.12 $\mathcal{A}^F=\mathcal{A}^{K_0}$ is Morse-Bott along $\Sigma$ the Fredholm section is regular at the boundary point $(0,p,0)$. It is well-known that a Fredholm section can be perturbed to a transverse Fredholm section given that its zero-set is compact. Since the Fredholm section is already transverse at the boundary point it suffices to perturb away from the boundary. Thus, assuming the claim we obtain from $\mathcal{M}$ a smooth compact manifold with boundary being the point $(0,p,0)$. Such a manifold does not exists. Thus, to finish the proof it remains to show the claim.

According to Lemma 2.7 we have for $(r,w)\in\mathcal{M}$ with $\lim_{s\to\infty}w=(p',0)$

$$
\begin{aligned}
E(w)&\leq \mathcal{A}_0^F(p,0)-\mathcal{A}_0^F(p',0)+\int_{-\infty}^{\infty}||\partial_sK_r||_-ds\\
&=\int_{-\infty}^{\infty}||\beta_r'(s)H||_-ds\\
&=\int_{-\infty}^{0}\beta_r'(s)||H||_-ds-\int_{0}^{\infty}\beta_r'(s)||H||_+ds\\
&=\beta_r(0)\big(||H||_-+||H||_+\big)\\
&\leq ||H||\;.
\end{aligned}
\tag{2.39}
$$

Moreover, if $r=0$ in the above then $E(w)=\mathcal{A}_0^F(p,0)-\mathcal{A}_0^F(p',0)=0$ thus $w$ is constant and therefore $w(s)=(p,0)$ for all $s\in\mathbb{R}$. In particular, for $r=0$ the only solution in $\mathcal{M}$ is $w(s)=(p,0)$. Finally, since $\mathcal{A}_0^F(p,0)=\mathcal{A}_0^F(p',0)=0$ the above computation implies

$$
-\,||H||\leq\mathcal{A}^{K_r}(w(s))\leq||H||\quad\forall s\in\mathbb{R}\;.
$$

Since we have uniform action bounds we know by Theorem 2.9 that the sequence $w_n$ converges (after choosing a subsequence) to some solution $v$ of the gradient flow equation. In case that $v(+\infty)\notin\Sigma$ (the other case is analogous) we choose an open set $U\subset\mathscr{L}\times\mathbb{R}$ containing only the constant critical points. Let $s_n$ be the first time so that $w_n(\sigma_n)\notin U$, i.e. the first exit time. This is well-defined for large enough $n$ since $v(+\infty)\notin\Sigma$. Now consider the reparametrised sequence $u_n:=\sigma_n*w_n:=w_n(\cdot+\sigma_n)$. By $C^\infty_{\mathrm{loc}}$ compactness the sequence $u_n$ converges to $u$ (after choice of a subsequence). Then $u$ is a non-constant gradient flowline since $u(0)\in\partial U$ and $u(-\infty)=(p,0)$ using again that $\Sigma$ is Morse-Bott, see Lemma 2.12. Thus, one of the following has to exist

1. a non-constant gradient flow line $v$ of $\mathcal{A}_0^F$ with one asymptotic end being $(p,0)$,
2. a gradient flow line $v$ of $\mathcal{A}^F_{\beta_\pm^\infty H}$, where $\beta_\pm^\infty$ is as above.

Moreover, $E(v)\leq\limsup E(w_n)\leq||H||<\wp(\Sigma,\alpha)$. In the first case the sequence $r_n$ converges, whereas in the second case $r_n\to\infty$. If there exists no leaf-wise intersection points, then the second case cannot occur since otherwise one asymptotic end of $v$ is a critical point of $\mathcal{A}_H^F$ which gives a leaf-wise intersection point according to Proposition 2.4.

In the first case not both asymptotic ends of $v$ can be of the form $(q,0)\in\mathrm{Crit}\mathcal{A}_0^F$ for some $q\in\Sigma$ since otherwise $E(v)=0$ according to Lemma 2.7. Hence the gradient flow line would be constant. Therefore, one asymptotic end of $v$ is of the form $(\gamma,\eta)$ where $\gamma$ is a Reeb orbit (contractible in $M$) of period $\eta\neq 0$. Thus, $|\eta|=|\mathcal{A}_0^F(\gamma,\eta)|=E(v)<\wp(\Sigma,\alpha)$, which contradicts the definition of $\wp(\Sigma,\alpha)$. This finishes the proof. □

**Lemma 2.13.** For any Hamiltonian function $H:S^1\times M\longrightarrow\mathbb{R}$ such that $\phi=\phi_H$ the leaf-wise intersection point found in Theorem A can be completed to a loop $\gamma$ by first following the flow of $\phi_H^t$ and then the Reeb flow in such a way that $\gamma$ is contractible in $M$.

Proof. From the previous proof it follows immediately that for the chosen Hamiltonian function $H$ the leaf-wise intersection point $x=u(0)$, where $(u,\eta)\in\mathrm{Crit}\mathcal{A}_H^F$, can be completed to a contractible loop $\gamma$. We observe that $\gamma(t)=\phi^t_{H+\eta F}(x)$ is a 1-periodic orbit of the Hamiltonian function $H+\eta F$. If $K$ is another Hamiltonian function with $\phi=\phi_K$, then $H+\eta F$ and $K+\eta F$ have the same time-1-maps $\phi_{H+\eta F}=\phi_{K+\eta F}$. Moreover, it follows from the existence of at least one contractible periodic orbit for the time-1-map of the flow $\phi^{-t}_{H+\eta F}\circ\phi^t_{K+\eta F}$ that the loop $\phi^t_{H+\eta F}(x)$ is contractible if and only if $\phi^t_{K+\eta F}(x)$ is contractible. The existence of a contractible periodic orbit for $\phi^{-t}_{H+\eta F}\circ\phi^t_{K+\eta F}$ follows from Floer's proof of the Arnold conjecture [Flo88a].

□

## 2.2. **The perturbed Rabinowitz action functional is generically Morse.** We set

$$\mathcal{H}:=\{H\in C^\infty(S^1\times M)\mid H(t,\cdot)=0\ \forall t\in[0,\tfrac12]\}\,. \tag{2.40}$$

The specific time support of functions $H\in\mathcal{H}$ is crucial in the proof of Proposition 2.4. Fortunately, the set $\mathcal{H}$ still generates $\mathrm{Ham}(M,\omega)$, see Lemma 2.3. Moreover, it is large enough so that the perturbed Rabinowitz action functional is generically Morse.

**Theorem 2.14.** *For a generic $H\in\mathcal{H}$ the perturbed Rabinowitz action functional $\mathcal{A}_H^F$ is Morse.*

Proof. The proof is postponed to the appendix A. □

**Remark 2.15.** It is straight forward to prove that $\mathcal{A}_H^F$ is Morse if one does not insist that $H$ has time support in $[\frac12,1]$, see [CFP08]. The proof of the genericity of the Morse property follows a standard scheme once it is shown that a certain linear operator is surjective. This operator is composed out of two summands. One is the Hessian of $\mathcal{A}_H^F$ and the other comes from the variation in $H$. Without restrictions on the time support surjectivity follows essentially directly from examining the second summand. In the situation of this paper this fails and we crucially use the Hessian.

## 2.3. **Rabinowitz Floer homology.** The definition of Floer homology $\mathrm{HF}(\mathcal{A}_H^F)$ proceeds as usual. We choose an $s$-independent $H:S^1\times M\longrightarrow\mathbb{R}$. In addition, we require that $H(t,\cdot)=0$ for all $t\in[0,\frac12]$. Moreover, we assume that the perturbed Rabinowitz action functional $\mathcal{A}_H^F$ is Morse. Then we define the $\mathbb{Z}/2$ vector space

$$\mathrm{CF}(\mathcal{A}_H^F):=\Big\{\xi=\sum_{c\in\mathrm{Crit}\mathcal{A}_H^F}\xi_c c\mid \xi_c\in\mathbb{Z}/2,\ \#\{c\mid\xi_c\neq0,\mathcal{A}_H^F(c)\geq\kappa\}<\infty\quad\forall\kappa\in\mathbb{R}\Big\} \tag{2.41}$$

and the moduli space

$$\mathcal{M}(c_-,c_+):=\Big\{w\mid w\text{ solves the gradient flow equation (2.15)},\ \lim_{s\to\pm\infty}=c_\pm\Big\}/\mathbb{R}\,. \tag{2.42}$$

Transversality for the moduli spaces $\mathcal{M}(c_-,c_+)$ can be achieved by abstract perturbation theory. For example, one can use the theory of polyfolds by Hofer-Wysocki-Zehnder. In fact, since there are no automorphism groups acting, the framework of $M$-polyfolds [HWZ07, HWZ09] is sufficient to achieve transversality. Indeed, the space of broken trajectories is an $M$-polyfold and the gradient flow equation is a Fredholm section into an $M$-polybundle. The moduli space $\mathcal{M}(c_-,c_+)$ is the zero set of this Fredholm section. Using the abstract perturbation theory developed in [HWZ09] then achieves transversality.

It also is conceivable that $\mathcal{M}(c_-,c_+)$ is smooth for a generic choice of an $S^1$-family $J(t,\cdot)$ of compatible almost complex structures similarly as in the work of [FHS95].

By abuse of notation the smooth manifold obtained by perturbing the gradient flow equation will again be denoted by $\mathcal{M}(c_-,c_+)$. We set $n(c_-,c_+)$ to be the $\mathbb{Z}/2$-number of elements in the zero-dimensional components of $\mathcal{M}(c_-,c_+)$. Then the linear map defined on generators by

$$\begin{aligned}\partial:\mathrm{CF}(\mathcal{A}^F_H)&\longrightarrow\mathrm{CF}(\mathcal{A}^F_H)\\ c&\mapsto\sum_d n(c,d)d\end{aligned}\tag{2.43}$$

satisfies $\partial^2=0$. We set $\mathrm{HF}(\mathcal{A}^F_H):=\mathrm{H}(\mathrm{CF}(\mathcal{A}^F_H),\partial)$.

**Theorem 2.16.** *If $H$ is such that $\mathcal{A}^F_H$ is a Morse function then*

$$\mathrm{HF}(\mathcal{A}^F_H)\cong\mathrm{RFH}(M,\Sigma)\ .\tag{2.44}$$

Proof. We choose an $s$-dependent homotopy from $H$ to 0. Because of Theorem 2.9 the usual continuation homomorphisms are well-defined and isomorphisms. We conclude

$$\mathrm{HF}(\mathcal{A}^F_H)\cong\mathrm{HF}(\mathcal{A}^F_0)=\mathrm{RFH}(M,\Sigma)\ .\tag{2.45}$$

□

2.4. **Proof of Theorem C.** Theorem C from the introduction is the following corollary of Theorem 2.16.

**Corollary 2.17.** *If $\mathrm{RFH}(M,\Sigma)\neq 0$, then there exists a leaf-wise intersection point for any $\phi\in\mathrm{Ham}_c(M,\omega)$.*

Proof. We assume by contradiction that there exists no leaf-wise intersection points. In particular, by Proposition 2.4 $\mathrm{Crit}\mathcal{A}^F_H=\emptyset$ and thus $\mathcal{A}^F_H$ is Morse with $0=\mathrm{HF}(\mathcal{A}^F_H)\cong\mathrm{RFH}(M,\Sigma)$. This contradiction finishes the proof. □

2.5. **Local Rabinowitz Floer homology.** In the following we assume that $\phi_H\in\mathrm{Ham}_c(M,\omega)$ is chosen so that $\mathcal{A}^F_H$ is Morse. For $||H||<\wp(\Sigma,\alpha)$ we define

$$\mathrm{Crit}_{\mathrm{loc}}(\mathcal{A}^F_H):=\Big\{(u,\eta)\in\mathrm{Crit}\mathcal{A}^F_H\mid u\text{ is contractible in }M,\ -||H||_+\leq\mathcal{A}^F_H(u,\eta)\leq||H||_-\Big\}\ .$$

We note that the set $\mathrm{Crit}_{\mathrm{loc}}(\mathcal{A}^F_H)$ is finite. This follows from the Arzela-Ascoli theorem since the Lagrange multiplier $\eta$ is uniformly bounded according to Lemma 2.11. We define the finite dimensional $\mathbb{Z}/2$ vector space

$$\mathrm{CF}_{\mathrm{loc}}(\mathcal{A}^F_H):=\mathrm{Crit}_{\mathrm{loc}}(\mathcal{A}^F_H)\otimes\mathbb{Z}/2\ .\tag{2.46}$$

$(\mathrm{CF}_{\mathrm{loc}}(\mathcal{A}^F_H),\partial_{\mathrm{loc}})$ is a differential complex since the action along gradient flow lines is decreasing. Define local Rabinowitz Floer homology by $\mathrm{HF}_{\mathrm{loc}}(\mathcal{A}^F_H):=\mathrm{H}(\mathrm{CF}_{\mathrm{loc}}(\mathcal{A}^F_H),\partial_{\mathrm{loc}})$.

**Definition 2.18.** We abbreviate the number of leaf-wise intersection points of $\phi_H \in \mathrm{Ham}_c(M,\omega)$ by $\nu_{\mathrm{leaf}}(\phi_H)$.

**Lemma 2.19.** If $\mathcal{A}_H^F$ is Morse and $||H|| < \wp(\Sigma,\alpha)$ the inequalities

$$\nu_{\mathrm{leaf}}(\phi_H) \geq \dim \mathrm{CF}_{\mathrm{loc}}(\mathcal{A}_H^F) \geq \dim \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_H^F)\ . \tag{2.47}$$

hold.

Proof. The second inequality is obvious. To prove the first inequality we point out that two critical points $(u,\eta) \neq (u',\eta') \in \mathrm{Crit}(\mathcal{A}_H^F)$ can give rise to the same leaf-wise intersection point only if the underlying leaf of the Reeb flow is closed. Indeed, if $u(\frac{1}{2}) = u'(\frac{1}{2})$ then according to Proposition 2.4 we know that $u(1) = \phi_H(u(\frac{1}{2})) = \phi_H(u'(\frac{1}{2})) = u'(1)$. Trivially, $u(1) = u(0) = u'(0) = u'(1)$. This is illustrated in figure 1. The map $u$ would be following the solid line, whereas the map $u'$ would follow the solid arc and the dotted part of the Reeb orbit.

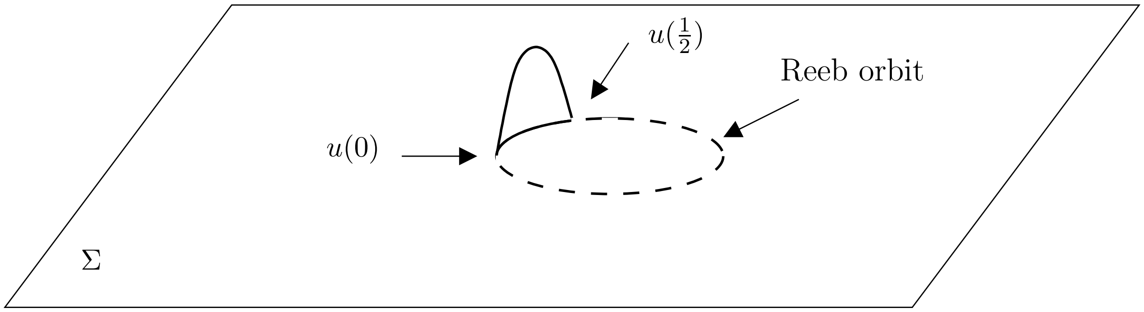

Figure 1.

We denote by $(u|_{[0,\frac{1}{2}]})^-$ the path $u|_{[0,\frac{1}{2}]}$ traversed in the opposite direction. Then, the map

$$\gamma := u'|_{[0,\frac{1}{2}]} \# (u|_{[0,\frac{1}{2}]})^- \tag{2.48}$$

is a closed loop in $\Sigma$ which (up to reparametrization) is a non-trivial Reeb orbit. The loop $\gamma$ is contractible in $M$ since $\gamma$ is homotopic to the loop $u' \# u^-$ which is the concatenation of two contractible loops and thus contractible. Next, we compute using $u|_{[\frac{1}{2},1]} = u'|_{[\frac{1}{2},1]}$

$$\begin{aligned}
\left|\mathcal{A}_H^F(u,\eta) - \mathcal{A}_H^F(u',\eta')\right| &= \Bigg| -\int_0^{\frac{1}{2}} u^*\alpha - \int_{\frac{1}{2}}^1 u^*\lambda - \eta \int_0^{\frac{1}{2}} \rho(t) \underbrace{G(u(t))}_{=0} dt - \int_{\frac{1}{2}}^1 H(t,u(t))dt \\
&\quad - \left( \int_0^{\frac{1}{2}} (u')^*\alpha - \int_{\frac{1}{2}}^1 (u')^*\lambda - \eta' \int_0^{\frac{1}{2}} \rho(t) \underbrace{G(u'(t))}_{=0} dt - \int_{\frac{1}{2}}^1 H(t,u'(t))dt \right) \Bigg| \\
&= \left| \int_{\frac{1}{2}}^1 (u')^*\alpha - \int_{\frac{1}{2}}^1 u^*\alpha \right| \\
&= \left| \int_{S^1} \gamma^*\alpha \right| \geq \wp(\Sigma,\alpha) > ||H||
\end{aligned} \tag{2.49}$$

If we assume that $(u,\eta) \neq (u',\eta') \in \mathrm{Crit}_{\mathrm{loc}}(\mathcal{A}_H^F)$ give rise to the same leaf-wise intersection, then by definition of $\mathrm{Crit}_{\mathrm{loc}}(\mathcal{A}_H^F)$ we have

$$||H|| = ||H||_+ + ||H||_- \geq \left|\mathcal{A}_H^F(u,\eta) - \mathcal{A}_H^F(u',\eta')\right| > ||H|| \;. \tag{2.50}$$

This contradiction finishes the proof. □

2.6. **Proof of Theorem B.** Theorem B from the introduction follows from Theorem 2.14, Lemma 2.19, and the following proposition.

**Proposition 2.20.** *If $\phi_H \in \mathrm{Ham}_c(M,\omega)$ satisfies $||\phi_H|| < \wp(\Sigma,\alpha)$ and if $\mathcal{A}_H^F$ is Morse, then there exists an injective homomorphism*

$$\theta : \mathrm{H}(\Sigma;\mathbb{Z}/2) \longrightarrow \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_H^F) \;. \tag{2.51}$$

Proof. We first observe that

$$\mathrm{H}(\Sigma;\mathbb{Z}/2) \cong \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_0^F) \;. \tag{2.52}$$

Indeed, this follows from the fact that locally around the action value 0 the Rabinowitz action functional $\mathcal{A}_0^F$ is Morse-Bott with critical manifold $\Sigma$, on which the action functional vanishes. Since the functional only has one critical value the complex of cascades, see [Fra04], computing the Morse-Bott homology $\mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_0^F)$ equals the Morse complex of the critical manifold $\Sigma$. Let $\theta$ be the continuation homomorphism $\theta : \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_0^F) \longrightarrow \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_H^F)$ in local Floer homology. With formula (2.17) and $||H||_+ + ||H||_- = ||H|| < \wp(\Sigma,\alpha)$ one checks via an energy-action estimate that $\theta$ is well-defined when using the homotopy $\beta_\infty^+(s)H$ from the proof of Theorem A, see equation (2.37). The same energy-action estimate shows that the reverse continuation homomorphism $\zeta : \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_H^F) \longrightarrow \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_0^F)$ is well-defined via the homotopy $\beta_\infty^-(s)H$. Applying a homotopy of homotopies $\beta_r(s)H$ as in the proof of Theorem A shows that

$$\zeta \circ \theta = \mathrm{id} : \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_0^F) \longrightarrow \mathrm{HF}_{\mathrm{loc}}(\mathcal{A}_0^F) \;, \tag{2.53}$$

namely no breaking along non-trivial Reeb occurs during the homotopy. Hence $\theta$ is injective. □

## Appendix A. $\mathcal{A}_H^F$ is generically Morse

In this appendix we prove Theorem 2.14.

A.1. **Preparations.** The proof of the genericity of the Morse property follows a standard scheme, that is, once it is shown that a certain linear operator is surjective the theorem follows from Sard-Smale's theorem. Unfortunately, the standard approach by linearizing the functional using some connection leads to finding solutions of a rather complicated ODE on the manifold $M$. To circumvent this we first transform the problem and then in the end obtain a linear ODE in a vector space.

First, let us recall the definition of the perturbed Rabinowitz action functional

$$\begin{aligned} \mathcal{A}_H^F &: \mathscr{L} \times \mathbb{R} \longrightarrow \mathbb{R} \\ (v,\eta) &\mapsto -\int_0^1 \lambda(v(t))[\partial_t v] - \int_0^1 H(t,v)dt - \eta\int_0^1 F(t,v)dt \end{aligned} \tag{A.1}$$

where from now on $\mathscr{L} \equiv W^{1,2}(S^1, M)$ is the (completed) loop space of $M$. For convenience we abbreviate

$$\begin{aligned} \mathcal{F} : \mathscr{L} &\longrightarrow \mathbb{R} \\ v &\mapsto \int_0^1 F(t,v)dt \ . \end{aligned} \tag{A.2}$$

and

$$\mathcal{A}_H(v) := -\int_0^1 \lambda(v(t))[\partial_t v] - \int_0^1 H(t,v)dt \ . \tag{A.3}$$

Thus, $\mathcal{A}_H^F(v,\eta) = \mathcal{A}_H(v) - \eta\mathcal{F}(v)$. We note that $\mathcal{A}_H^F(v,\eta) = \mathcal{A}_{\eta_0 F+H}(v) + (\eta_0 - \eta)\mathcal{F}(v)$, and therefore

$$d\mathcal{A}_H^F(v,\eta)[\hat{v},\hat{\eta}] = d\mathcal{A}_{\eta_0 F+H}(v)[\hat{v}] - \hat{\eta}\mathcal{F}(v) + (\eta_0 - \eta)d\mathcal{F}(v)[\hat{v}] \tag{A.4}$$

where $\hat{v} \in \Gamma^{1,2}(v^*TM)$, the space of $W^{1,2}$ vector fields along $v$, and $\hat{\eta} \in \mathbb{R}$. Hence at a critical point $x_0 = (v_0, \eta_0) \in \mathrm{Crit}\mathcal{A}_H^F$ the Hessian equals

$$\mathscr{H}_{\mathcal{A}_H^F}(x_0)[(\hat{v}_1,\hat{\eta}_1),(\hat{v}_2,\hat{\eta}_2)] = \mathscr{H}_{\mathcal{A}_{\eta_0 F+H}}(v_0)[\hat{v}_1,\hat{v}_2] - \hat{\eta}_1 d\mathcal{F}(v_0)[\hat{v}_2] - \hat{\eta}_2 d\mathcal{F}(v_0)[\hat{v}_1] \ . \tag{A.5}$$

For a function $P : [0,1] \times M \longrightarrow \mathbb{R}$ and corresponding $\phi_P^1 \in \mathrm{Ham}(M,\omega)$ we define

$$\mathscr{L}_P := \{ w \in W^{1,2}([0,1], M) \mid w(0) = \phi_P^1(w(1)) \} \ , \tag{A.6}$$

the twisted loop space, and introduce the diffeomorphism $\Phi_P : \mathscr{L}_P \longrightarrow \mathscr{L}$

$$\Phi_P(w)(t) = \phi_P^t(w(t)) \ . \tag{A.7}$$

For a fixed critical point $x_0 = (v_0, \eta_0)$ of $\mathcal{A}_H^F$ we use this diffeomorphism to pull back $\mathcal{A}_H^F$

$$\widetilde{\mathcal{A}}_{\eta_0,H}^F = (\Phi_{\eta_0 F+H} \times \mathrm{id}_{\mathbb{R}})^* \mathcal{A}_H^F : \mathscr{L}_{\eta_0 F+H} \times \mathbb{R} \longrightarrow \mathbb{R} \ . \tag{A.8}$$

We set $w_0 := \Phi_{\eta_0 F+H}^{-1} \circ v_0$, thus $w_0 =$const. Then using $\big(\Phi_H^* d\mathcal{A}_H\big)(w)[\hat{w}] = \int \omega(\partial_t w, \hat{w})$ we obtain

$$\mathscr{H}_{\widetilde{\mathcal{A}}_{\eta_0,H}^F}(w_0,\eta_0)[(\hat{w}_1,\hat{\eta}_1),(\hat{w}_2,\hat{\eta}_2)] = \int_0^1 \omega(\partial_t \hat{w}_1, \hat{w}_2)dt - \hat{\eta}_1 d\widetilde{\mathcal{F}}(w_0)[\hat{w}_2] - \hat{\eta}_2 d\widetilde{\mathcal{F}}(w_0)[\hat{w}_1] \ . \tag{A.9}$$

where $\widetilde{\mathcal{F}} = \mathcal{F} \circ \Phi_{\eta_0 F+H}$. Using the special form of $F$ (see equation (2.2)) and $H \in \mathcal{H}$ (see equation (2.40)) we compute

$$\begin{aligned} \widetilde{\mathcal{F}}(w) &= \int_0^1 F(t, \phi_{\eta_0 F+H}^t(w))dt = \int_0^{\frac{1}{2}} F(t, \phi_{\eta_0 F+H}^t(w))dt \\ &= \int_0^{\frac{1}{2}} F(t, \phi_{\eta_0 F}^t(w))dt = \int_0^{\frac{1}{2}} F(t,w)dt \\ &= \int_0^1 F(t,w)dt \end{aligned} \tag{A.10}$$

Thus, the Hessian of $\widetilde{\mathcal{A}}_{\eta_0,H}^F$ simplifies as follows (after integrating by parts)

$$\begin{aligned} &\mathscr{H}_{\widetilde{\mathcal{A}}_{\eta_0,H}^F}(w_0,\eta_0)[(\hat{w}_1,\hat{\eta}_1),(\hat{w}_2,\hat{\eta}_2)] \\ &\qquad = \int_0^1 \omega(\partial_t \hat{w}_1, \hat{w}_2)dt - \hat{\eta}_1 \int_0^1 dF(t,w_0)[\hat{w}_2] - \hat{\eta}_2 \int_0^1 dF(t,w_0)[\hat{w}_1] \end{aligned} \tag{A.11}$$

A.2. **The linearized operator.** We denote by $\mathcal{H}^k = \{H \in C^k(S^1 \times M) \mid H(t,\cdot) = 0\ \forall t \in [0, \frac{1}{2}]\}$. Moreover, for $w \in \mathscr{L}_H$ (see equation (A.6) for the definition) we define the bundle $\mathcal{E}_H \longrightarrow \mathscr{L}_H$ by

$$(\mathcal{E}_H)_w := L^2([0,1], w^*TM)\ . \tag{A.12}$$

**Definition A.1.** Let $(v_0, \eta_0)$ be a critical point of $\mathcal{A}_H^F$ and $(w_0, \eta_0)$ the corresponding critical point of $\widetilde{\mathcal{A}}_{\eta_0,H}^F$, that is, defined by the equation $v_0 = \Phi_{\eta_0 F+H}(w_0)$. Then we define the linear operator

$$L_{(w_0,\eta_0,H)} : (T_{w_0}\mathscr{L}_{\eta_0 F+H}) \times \mathbb{R} \times \mathcal{H} \longrightarrow (\mathcal{E}_{\eta_0 F+H})^\vee \times \mathbb{R} \tag{A.13}$$

via the pairing with $(\hat{w}_2, \hat{\eta}_2) \in (\mathcal{E}_{\eta_0 F+H}) \times \mathbb{R}$

$$\begin{aligned}\langle L_{(w_0,\eta_0,H)}[\hat{w}_1, \hat{\eta}_1, \hat{H}], (\hat{w}_2, \hat{\eta}_2)\rangle := {}& \mathscr{H}_{\widetilde{\mathcal{A}}_{\eta_0,H}^F}(w_0,\eta_0)[(\hat{w}_1,\hat{\eta}_1),(\hat{w}_2,\hat{\eta}_2)] \\ &+ \int_0^1 d((\Phi_{\eta_0 F+H})^*\hat{H})(t,w_0)[\hat{w}_2(t)]dt\end{aligned} \tag{A.14}$$

**Proposition A.2.** *The operator $L_{(w_0,\eta_0,H)}$ is surjective. In fact, $L_{(w_0,\eta_0,H)}$ is surjective when restricted to the space*

$$\mathcal{V} := \{(\hat{w}, \hat{\eta}, \hat{H}) \in (T_{w_0}\mathscr{L}_{\eta_0 F+H}) \times \mathbb{R} \times \mathcal{H} \mid \hat{w}(\tfrac{1}{2}) = 0\}\ . \tag{A.15}$$

**Remark A.3.** The additional assertion of the surjectivity of $L_{(w_0,\eta_0,H)}|_{\mathcal{V}}$ is not used in the current article but will prove useful in the future. Since it added only two lines we decided to include it here.

PROOF. The $L^2$-Hessian is a self-adjoint Fredholm operator. Thus, the operator $L_{(w_0,\eta_0,H)}$ has closed image. Therefore, it suffices to prove that the annihilator of the image of $L_{(w_0,\eta_0,H)}$ vanishes. Let $(\hat{w}_2, \hat{\eta}_2)$ be in the annihilator of the image of $L_{(w_0,\eta_0,H)}$, that is

$$\langle L_{(w_0,\eta_0,H)}[\hat{w}_1, \hat{\eta}_1, \hat{H}], (\hat{w}_2, \hat{\eta}_2)\rangle = 0 \tag{A.16}$$

for all $(\hat{w}_1, \hat{\eta}_1, \hat{H}) \in (T_{w_0}\mathscr{L}_{\eta_0 F+H}) \times \mathbb{R} \times \mathcal{H}$. This is equivalent to the following two equations:

$$\mathscr{H}_{\widetilde{\mathcal{A}}_{\eta_0,H}^F}(w_0,\eta_0)[(\hat{w}_1,\hat{\eta}_1),(\hat{w}_2,\hat{\eta}_2)] = 0 \qquad \forall (\hat{w}_1,\hat{\eta}_1) \in (T_{w_0}\mathscr{L}_{\eta_0 F+H}) \times \mathbb{R} \tag{A.17}$$

and

$$\int_0^1 d\hat{H}_t(\phi^t_{\eta_0 F+H}(w_0))[d\phi^t_{\eta_0 F+H}(w_0)[\hat{w}_2]] = 0 \qquad \forall \hat{H} \in \mathcal{H} \tag{A.18}$$

Since the Hessian $\mathscr{H}_{\widetilde{\mathcal{A}}_{\eta_0,H}^F}$ is a self-adjoint operator, equations (A.11) and (A.17) imply by elliptic regularity that $\hat{w}_2 \in C^{k+1}([0,1], M)$ and satisfies the equation

$$\partial_t \hat{w}_2 - \hat{\eta}_2 X_F(t, w_0) = 0 \tag{A.19}$$

and the linearized boundary condition

$$\hat{w}_2(0) = d\phi^1_{\eta_0 F+H}(w_0)[\hat{w}_2(1)]\ . \tag{A.20}$$

In fact, when the Hessian is restricted to $\mathcal{V}$ then equation (A.19) holds for all $t \neq \frac{1}{2}$, since the Hessian is a local operator. Thus, by continuity, equation (A.19) holds for all $t$ in any case.

From equation (A.18) we deduce that

$$\hat{w}_2(t) = 0 \quad \forall t \in [\tfrac{1}{2}, 1]\ . \tag{A.21}$$

Using $F(t,x) = \rho(t)G(x)$ we rewrite equation (A.19)

$$\partial_t \hat{w}_2 - \hat{\eta}_2 \rho(t) X_G(w_0) = 0\ . \tag{A.22}$$

This is a linear ODE in the vector space $T_{w_0}M$ which we can solve

$$\hat{w}_2(t) = \hat{w}_2(0) + \hat{\eta}_2 \left( \int_0^t \rho(\tau) dt \right) X_G(w_0) \ . \tag{A.23}$$

We recall (see equation (2.2)) that $F(t,x) = \rho(t)G(x)$ where $\int_0^t \rho(t)dt = 1$ for all $t \in [\frac{1}{2}, 1]$. Combining this with equation (A.21) we conclude for $t \geq \frac{1}{2}$

$$0 = \hat{w}_2(t) = \hat{w}_2(0) + \hat{\eta}_2 X_G(w_0) \ . \tag{A.24}$$

Combining equations (A.20) and (A.21) at $t = 1$ we derive $\hat{w}_2(0) = 0$. Hence, by equation (A.24) we have

$$\hat{\eta}_2 X_G(w_0) = 0 \ . \tag{A.25}$$

Since $(w_0, \eta_0)$ comes from a critical point $(v_0, \eta_0)$ of $\mathcal{A}_H^F$ we know $G(v(0)) = G(w_0) = 0$, and therefore, $X_G(w_0) \neq 0$ since 0 was assumed to be a regular of $G$. In particular,

$$\hat{\eta}_2 = 0 \tag{A.26}$$

Equations (A.23) and (A.26) immediately imply

$$\hat{w}_2(t) = 0 \quad \forall t \in [0,1] \ . \tag{A.27}$$

Therefore, the annihilator of the image of $L_{w_0,\eta_0,H}$ vanishes and thus $L_{w_0,\eta_0,H}$ is surjective. □

A.3. **Proof of Theorem 2.14.** We recall that $\mathscr{L} = W^{1,2}(S^1, M)$ and $\mathcal{H}^k = \{H \in C^k(S^1 \times M) \mid H(t, \cdot) = 0 \ \forall t \in [0, \frac{1}{2}]\}$. We define the Banach space bundle $\mathcal{E} \longrightarrow \mathscr{L}$ by $\mathcal{E}_v = L^2(S^1, v^*TM)$. We consider the section $S : \mathscr{L} \times \mathbb{R} \times \mathcal{H}^k \longrightarrow \mathcal{E}^\vee \times \mathbb{R}$ given by the differential of the Rabinowitz action functional $\mathcal{A}_H^F$

$$S(v, \eta, H) := d\mathcal{A}_H^F(v, \eta) \ . \tag{A.28}$$

where the perturbation $H \in \mathcal{H}^k$ is considered an additional variable. Its vertical differential $DS : T_{(v_0,\eta_0,H)}\mathscr{L} \times \mathbb{R} \times \mathcal{H}^k \longrightarrow \mathcal{E}^\vee_{(v_0,\eta_0,H)}$ at $(v_0, \eta_0, H) \in S^{-1}(0)$ is

$$DS_{(v_0,\eta_0,H)}[(\hat{v}, \hat{\eta}, \hat{H})] = \mathscr{H}_{\mathcal{A}_H^F}(v_0, \eta_0)\big[(\hat{v}, \hat{\eta}, \hat{H})\, ; \bullet\big] + \int_0^1 \hat{H}(t, v_0) dt \tag{A.29}$$

Since the pull-back of $DS$ under the diffeomorphism $\Phi_{\eta_0 F + H} \times \mathrm{id}_{\mathbb{R}} \times \mathrm{id}_{\mathcal{H}^k}$ is the operator $L_{(w_0,\eta_0,H)}$ in Proposition A.2, the operator $DS$ is surjective. Thus, by the implicit function theorem the universal moduli space

$$\mathcal{M} := S^{-1}(0) \tag{A.30}$$

is a smooth Banach manifold. We consider the projection $\Pi : \mathcal{M} \longrightarrow \mathcal{H}^k$. Then the $\mathcal{A}_H^F$ is Morse if and only if $H$ is a regular value of $\Pi$, which by the theorem of Sard-Smale form a generic set (for $k$ large enough). Moreover, the Morse condition is $C^k$-open. Thus, for functions in an open and dense subset of $\mathcal{H}^k$ the Rabinowitz action functional is Morse. Taking the intersection of all $k$ concludes the proof of Theorem 2.14. □
